Responsibilities:

-Backend super star, implemented Cloudinary,
helped Thomas with routes, helped Alan with
Heroku issues, helped with chabox issues.

Creator

Avi: Front-End Developer

Responsibilities:

- Kept up with the front end of the project, made sure everything was aligned, buttons were routing, made sure back-end work was “prettified” on the front-end aspect.

Creator

Christian: Designer

Responsibilities:

Helped with Design, wireframe

Concept

We wanted to create a website what would facilitate our users on their bidding efforts. Our website allows users to view bids, upload their own items, as well as contain a chat room that lets users communicate with other user's.

The Process

What our website contains:

Sequelize, Express, Mysql, Bootstrap, Handlebars, Socket.io, Cloudinary

Challenges

- Making out Login page function correctly without errors.
- Understanding Socket.io, Cloudinary, and Stripe
- Making sure front-end development didn't conflict with back-end development
- Merging conflicts

Future Developments

Future developments:

- Adding a way for user's to see who is selling items near them.
- Adding the ability to search for specific items.
- Create a way to show more info on the homepage for each bid.
- Understand and incorporate Stripe.js.
- Adding a customer support field.
